# Mg – BASED METAL MATRIX COMPOSITES

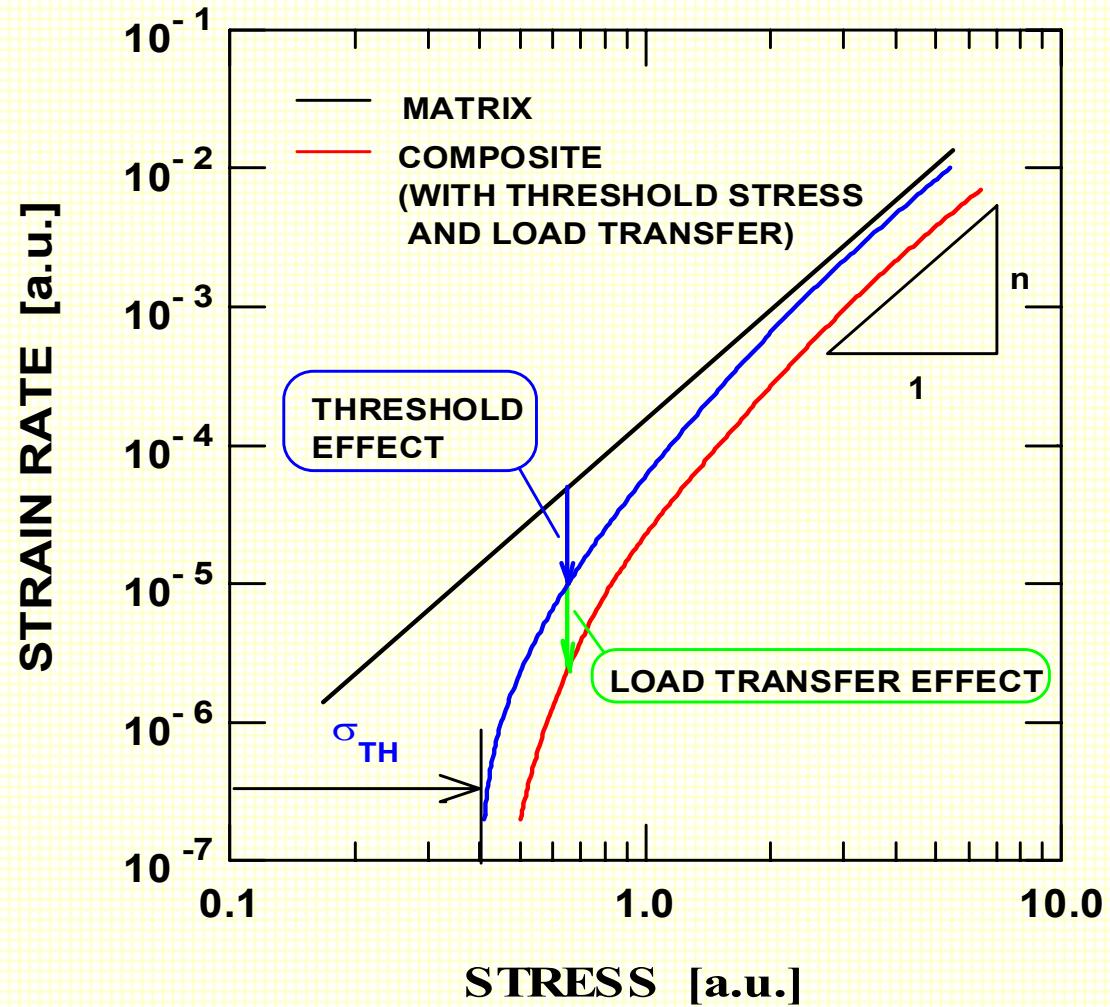

**The property profile achieved is determined by:**

the raw materials used

## the production procedures

- matrix alloy
  - nature of reinforcement (fibres, particles, ...)
  - chemical composition of reinforcement
  - morphology, volume fraction and distribution of reinforcement
  - manufacturing process
  - subsequent treatment

# COMPOSITE STRENGTHENING EFFECTS IN CREEP

## EXPERIMENTAL MATERIALS

TU Clausthal, Germany – squeeze casting

### AZ 91 MAGNESIUM ALLOY

composition: 9wt%Al+1wt%Zn+0.3wt%Mn

### AZ 91 – 20 vol% $\text{Al}_2\text{O}_3$ (f) COMPOSITE

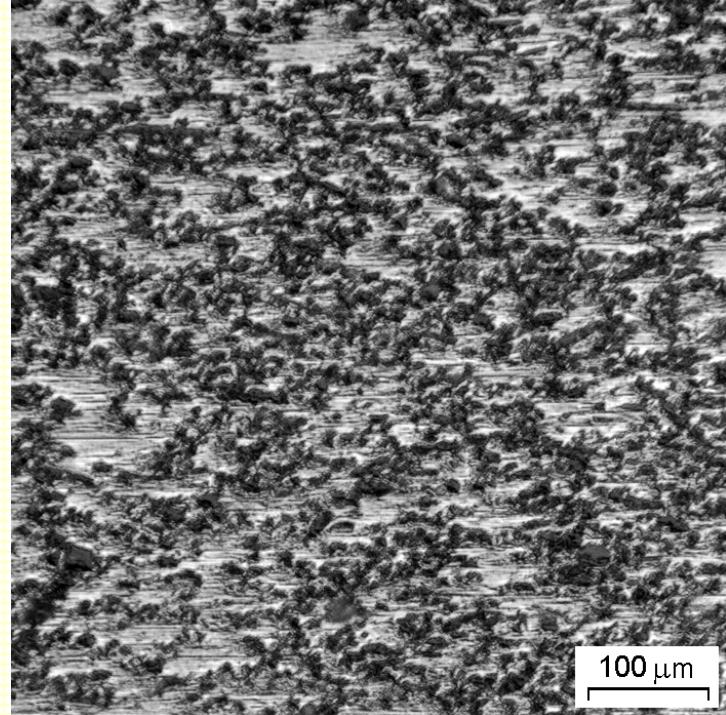

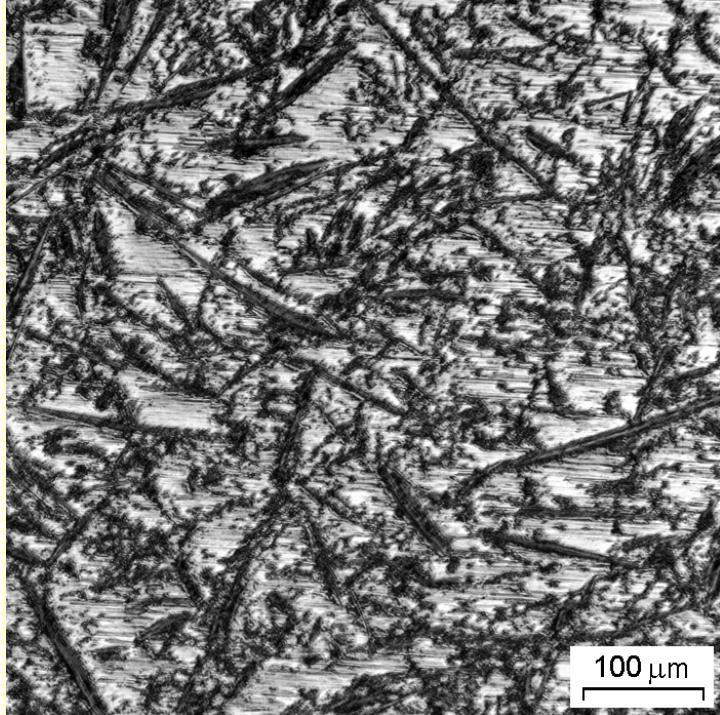

20 vol% of Saffil  $\delta$  -  $\text{Al}_2\text{O}_3$  fibres

diameter  $\sim 3 \mu\text{m}$ , length  $1 \sim 100 \mu\text{m}$

planar random distribution

T6 heat treatment annealing: 688 K/ 24h  
ageing: 443 K/ 24h

## AZ 91 – 20 vol.% Al<sub>2</sub>O<sub>3</sub> composite

Optical micrographs showing microstructure of the composite in two perpendicular directions

## EXPERIMENTAL MATERIALS (cont.)

### **QE 22 MAGNESIUM ALLOY**

composition: 2.5wt%Ag+2.0wt%Nd rich rare earths+0.6wt%Zr

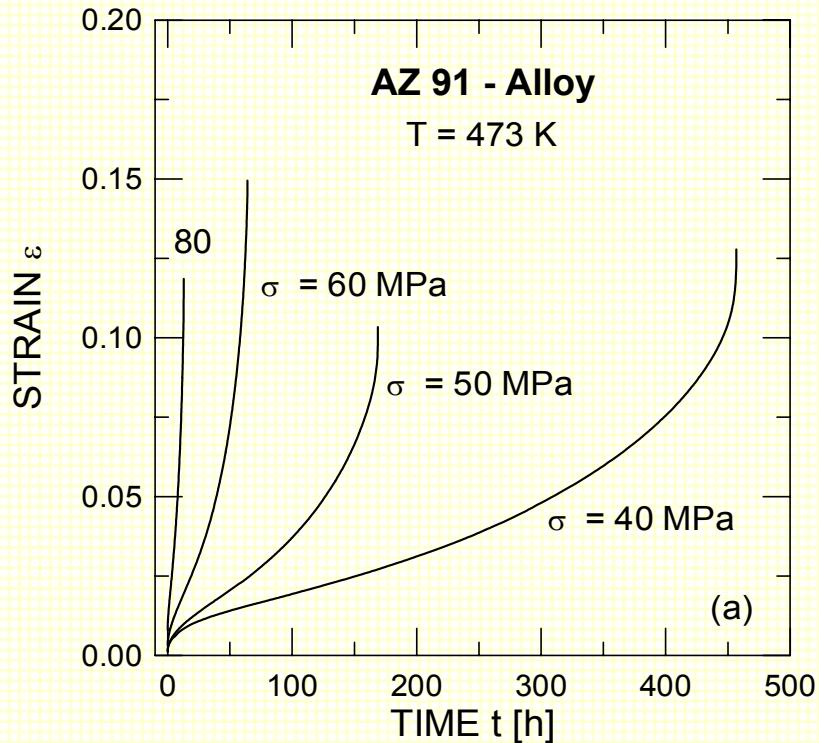

### **QE 22 – 20 vol% $\text{Al}_2\text{O}_3$ (f) COMPOSITE**

**T6 heat treatment** annealing: 803 K/ 6h  
ageing: 447 K/ 8h

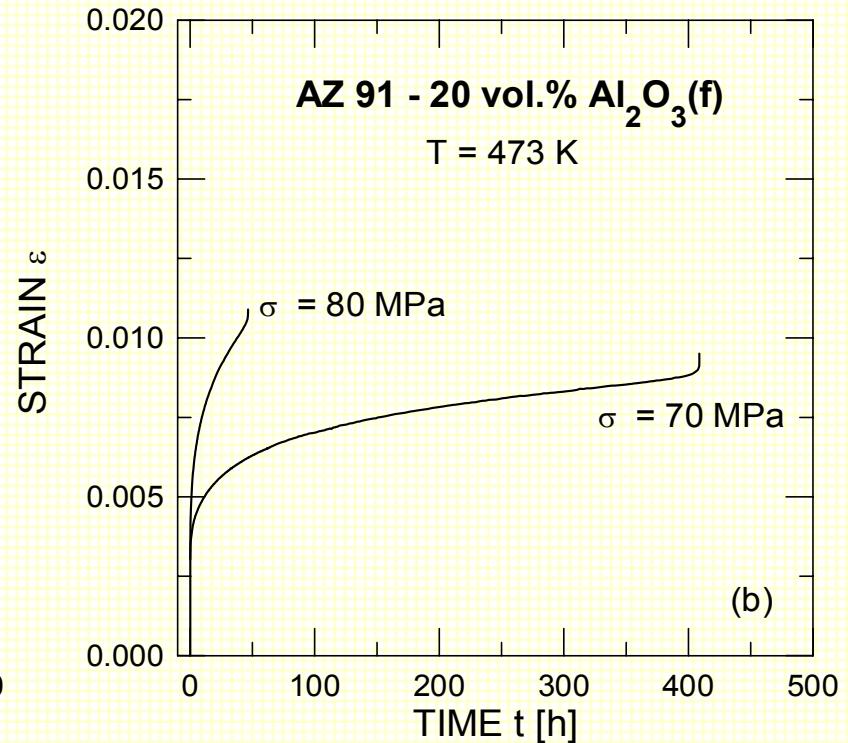

### **CREEP TESTING**

- constant stress tensile creep tests
- testing temperatures: from 423 to 523 K
- applied stresses: from 10 to 200 MPa

# CREEP CURVES

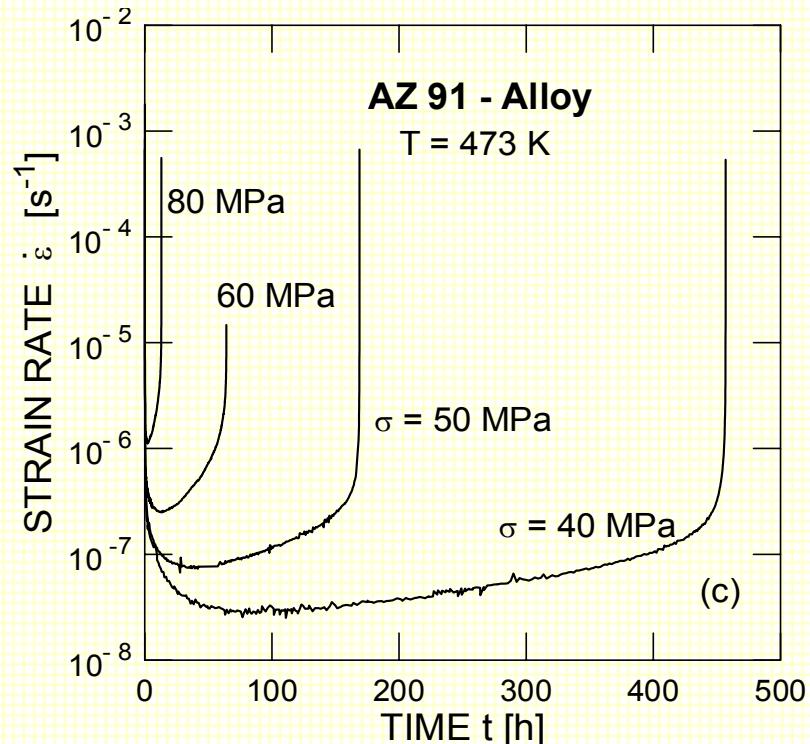

MONOLITHIC ALLOY

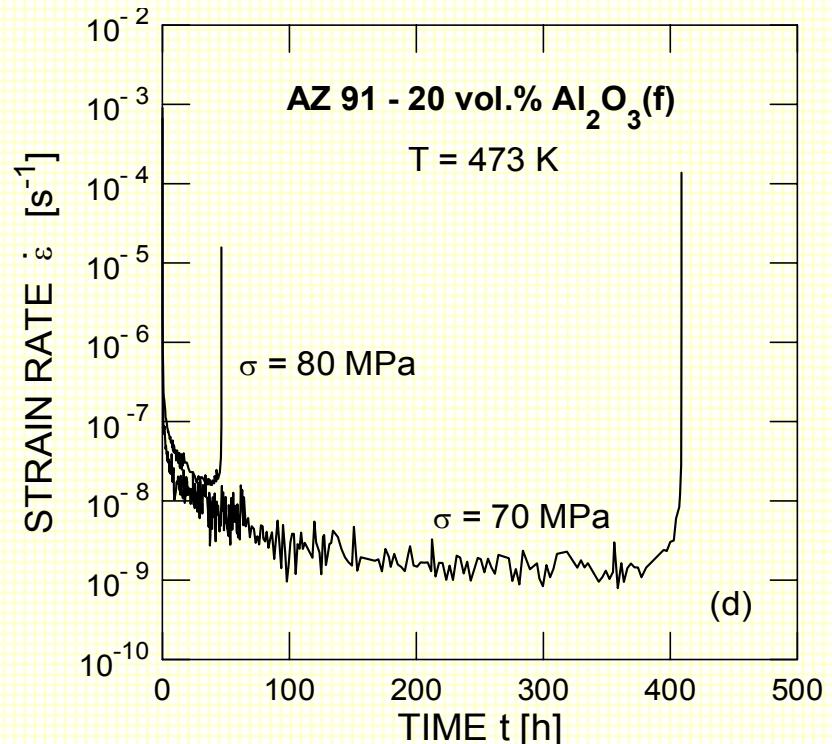

COMPOSITE

Creep curves for AZ 91 alloy and its composite at 473 K

# CREEP CURVES

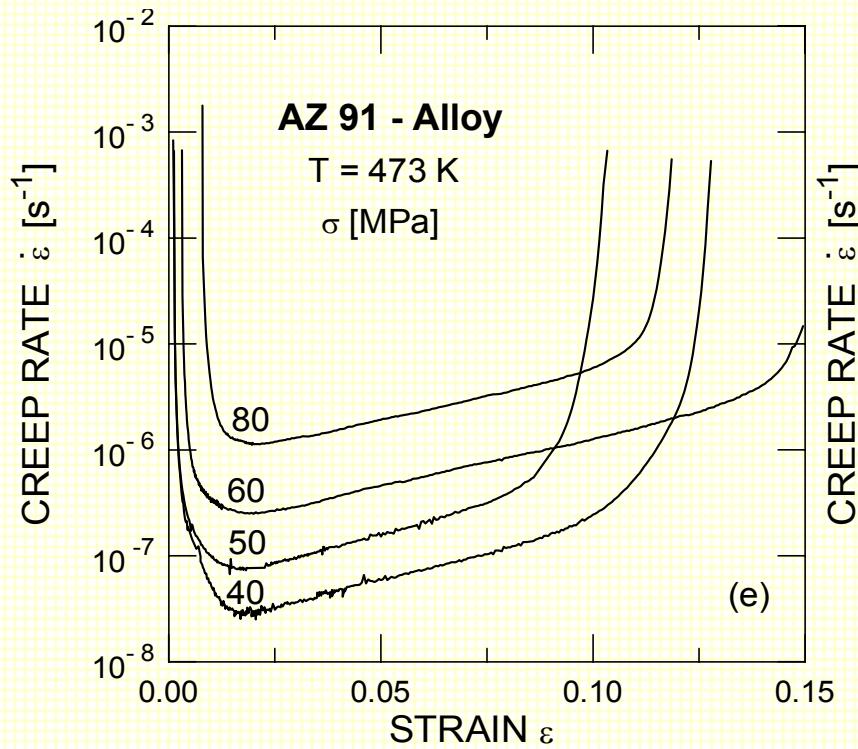

MONOLITHIC ALLOY

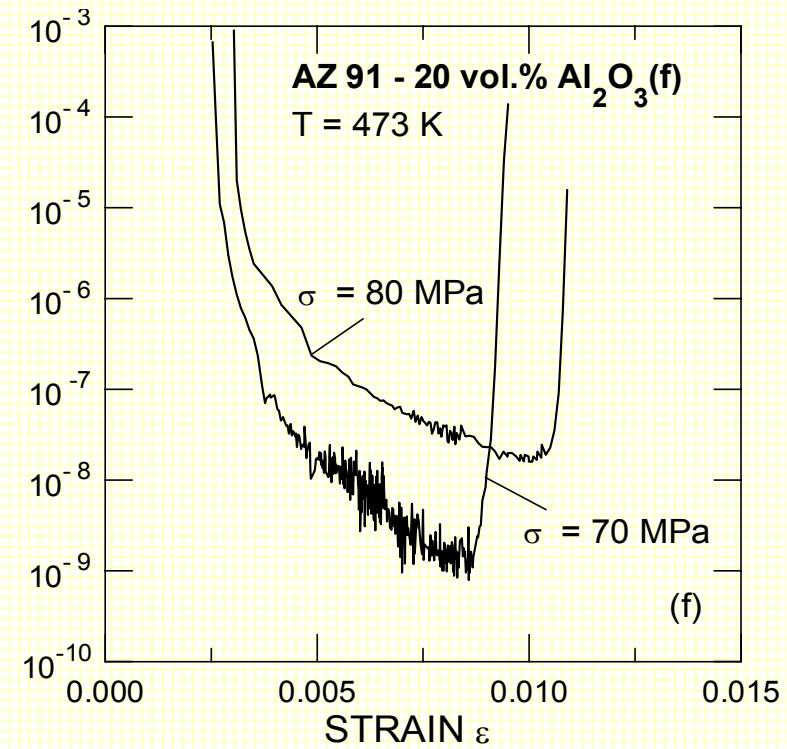

COMPOSITE

Time dependences of strain rate for AZ 91 alloy and its composite at 473 K

# CREEP CURVES

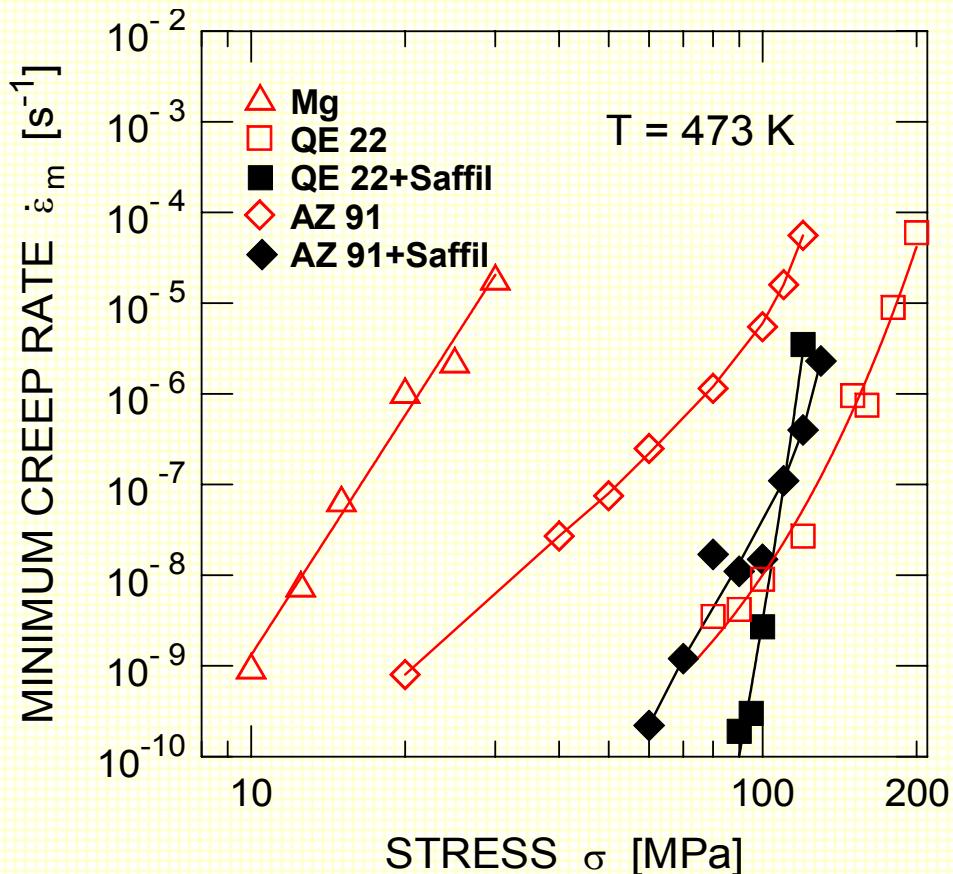

MONOLITHIC ALLOY

COMPOSITE

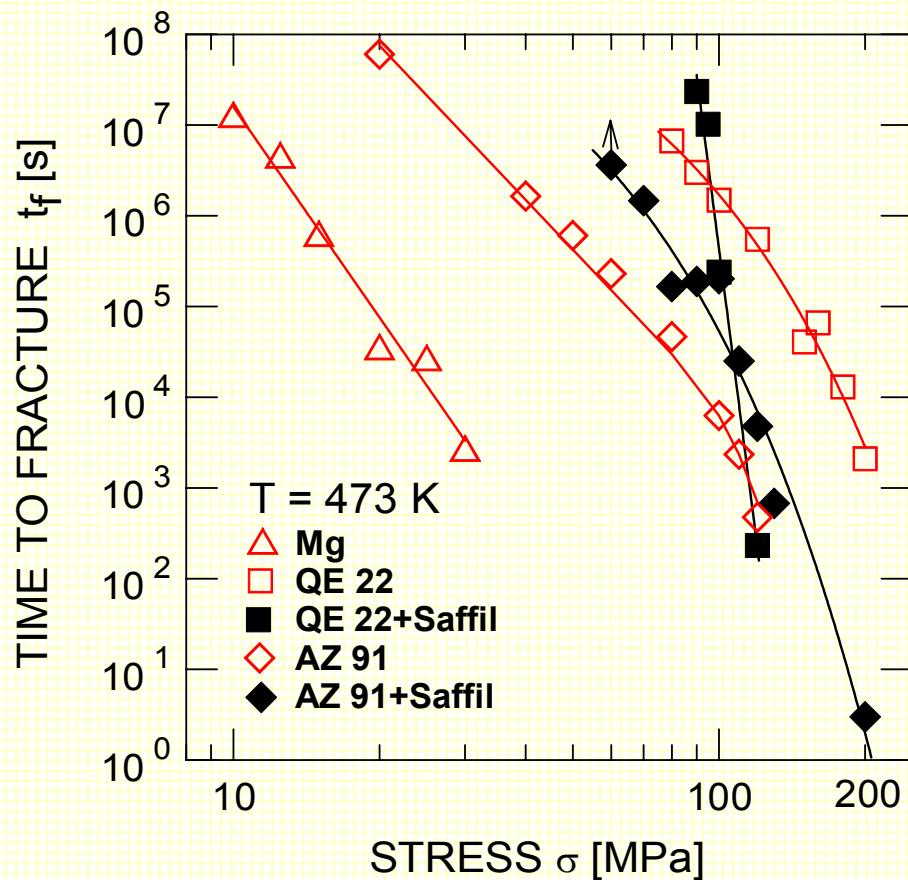

Dependences of strain rate on strain for AZ 91 alloy and its composite at 473 K

# CREEP RESULTS

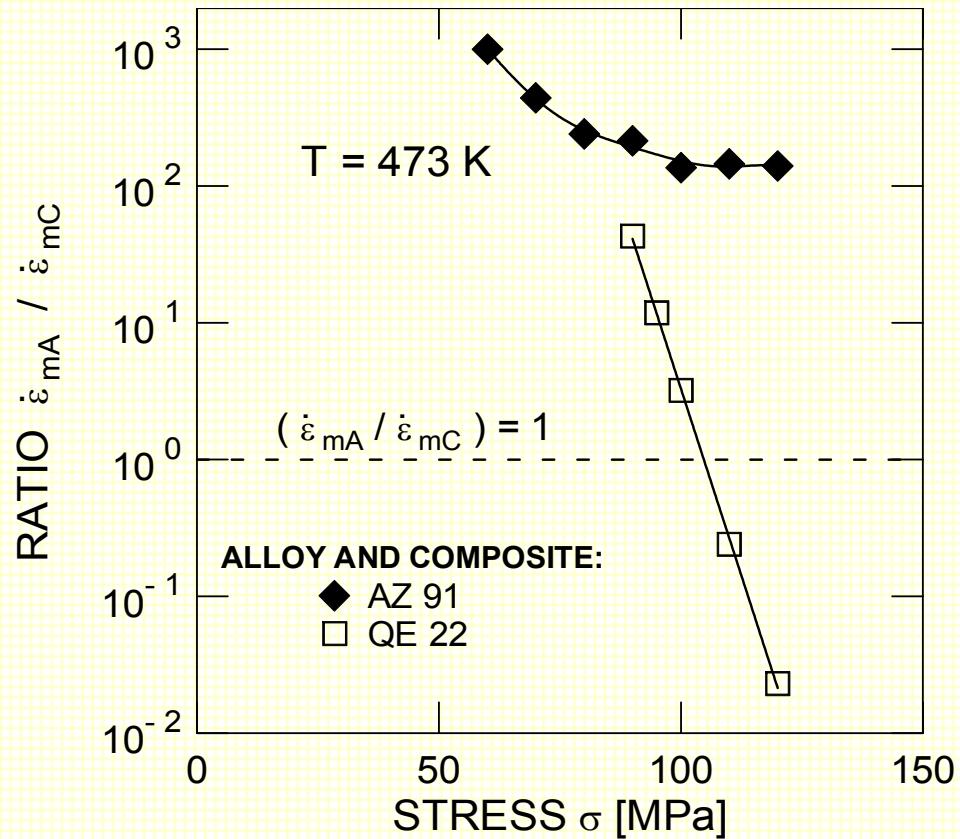

Minimum creep rate versus stress for the monolithic alloys  
and their short-fibre composites

# CREEP RESULTS

Time to fracture versus stress for the monolithic alloys  
and their short-fibre composites

# CREEP RESULTS

Effect of composite strengthening demonstrated by the ratios of minimum creep rate of the monolithic alloy and the composite

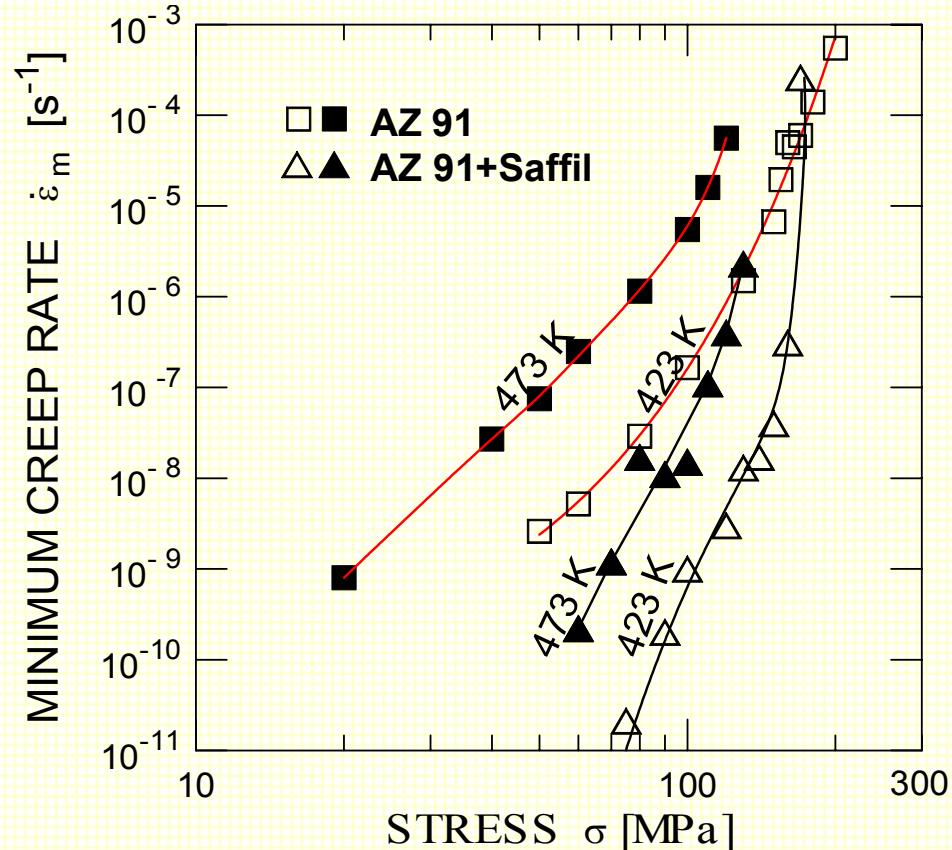

What

**WHAT IS (ARE) THE REASON(S) FOR BETTER CREEP RESISTANCE OF THE COMPOSITE?**

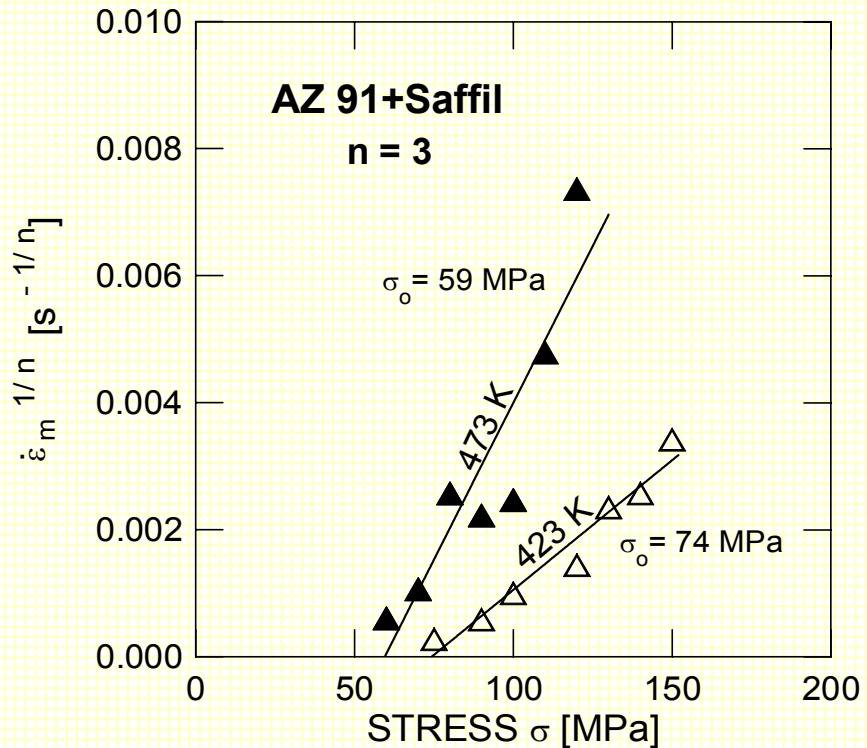

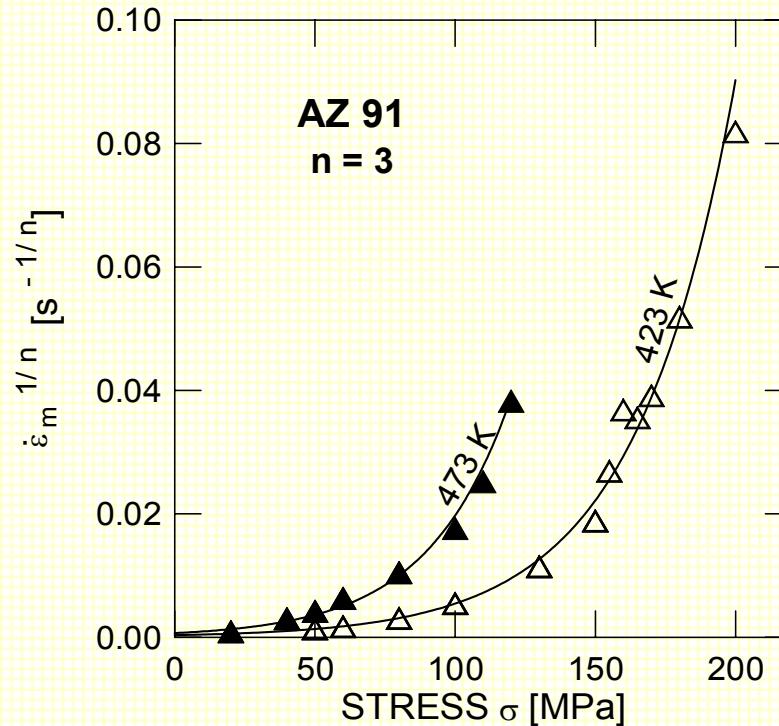

**WHAT IS THE LIMITING FACTOR OF SHORT-FIBRE REINFORCEMENT?**

# CREEP RESULTS

Stress dependences of minimum creep rate for the AZ 91 alloy and the AZ 91 – 20 vol.% Al<sub>2</sub>O<sub>3</sub>(f) composite at 423 and 473 K

# THRESHOLD STRESS

Determination of the threshold stress for:

**AZ 91 alloy**  
**(no threshold stress)**

**AZ 91 – Saffil composite**

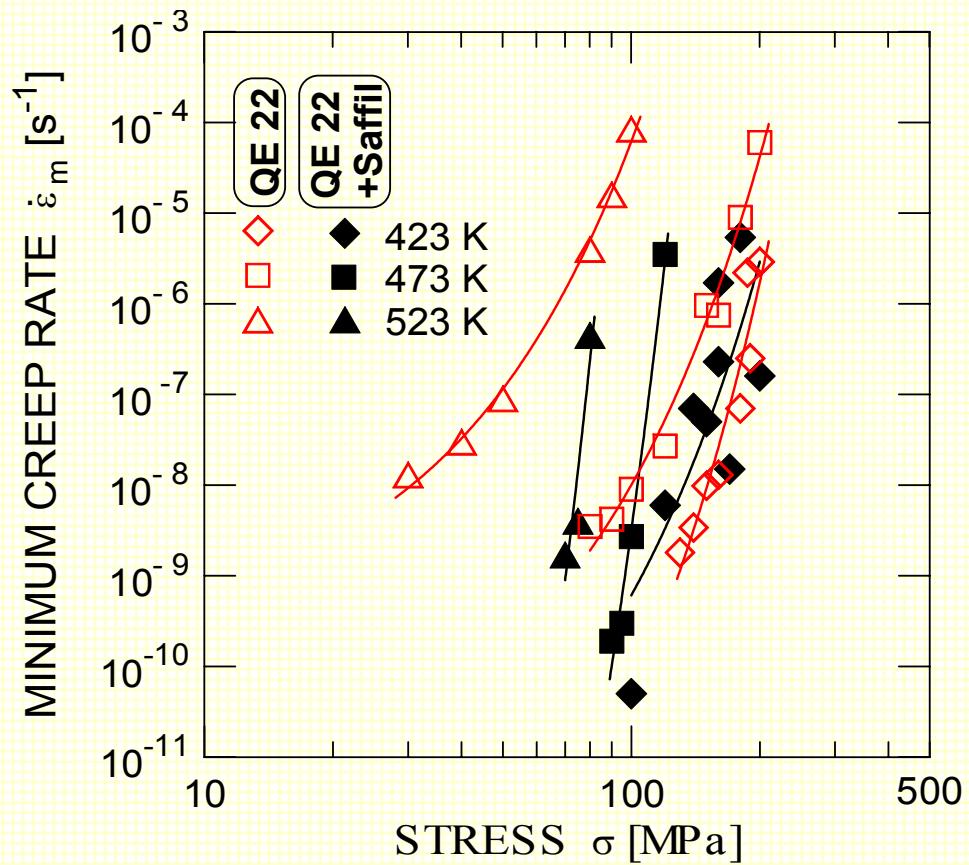

# LOAD TRANSFER

The values of  $\underline{\alpha}$  (a load transfer coefficient)

$$\dot{\varepsilon}_c / \dot{\varepsilon}_m = (1 - \alpha)^n \quad n = 3$$

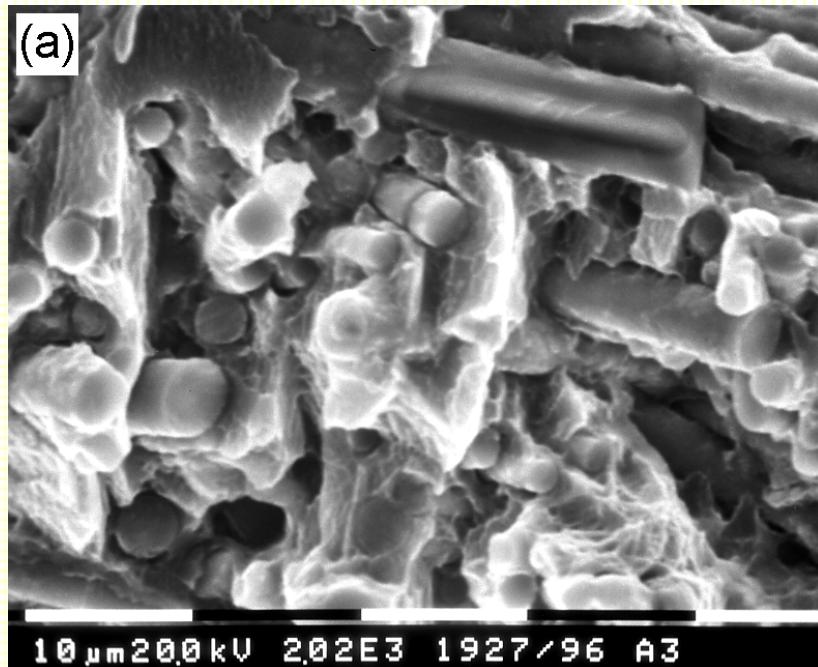

T [K]	$\sigma$ [MPa]	$\dot{\varepsilon}_c$ [ $s^{-1}$ ]	$\dot{\varepsilon}_m$ [ $s^{-1}$ ]	$\underline{\alpha}$
423	90	2.45/-10	1.1/-7	0.869
	100	6.97/-10	2.34/-7	0.856
	125	6.4/-9	1.15/-6	0.822
	150	3.9-8	4.27/-6	0.790
473	50	7.5/-11	8.61/-8	0.904
	70	1.36/-9	5.48/-7	0.864
	90	1.18/-8	2.18/-6	0.824
	100	2.94/-8	3.89/-6	0.803

# CREEP RESULTS

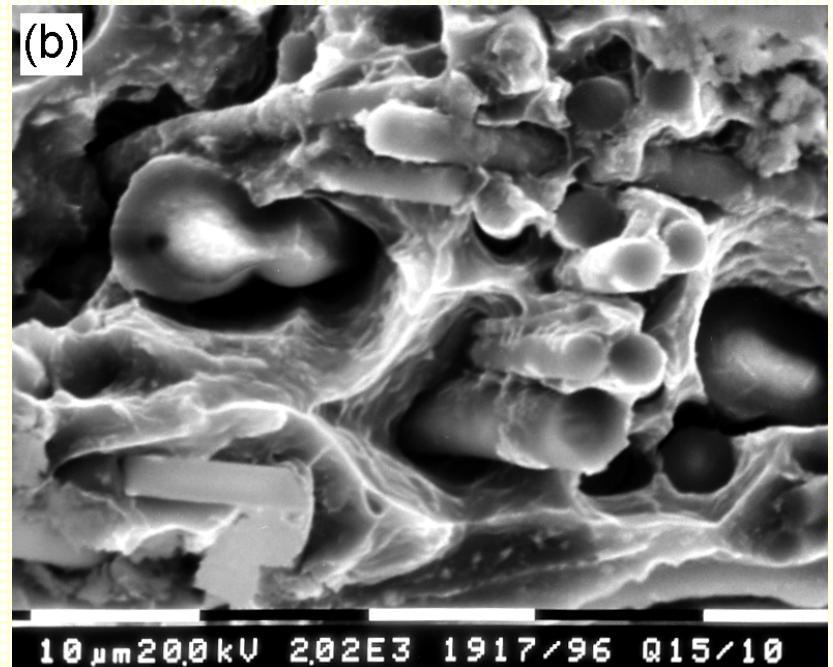

Stress dependences of minimum creep rates for the QE 22 alloy and the QE 22 – 20 vol.%  $\text{Al}_2\text{O}_3(f)$  composite at 423, 473 and 523 K

# CREEP FRACTURE SURFACES (SEM)

AZ 91 + 20 vol.% COMPOSITE

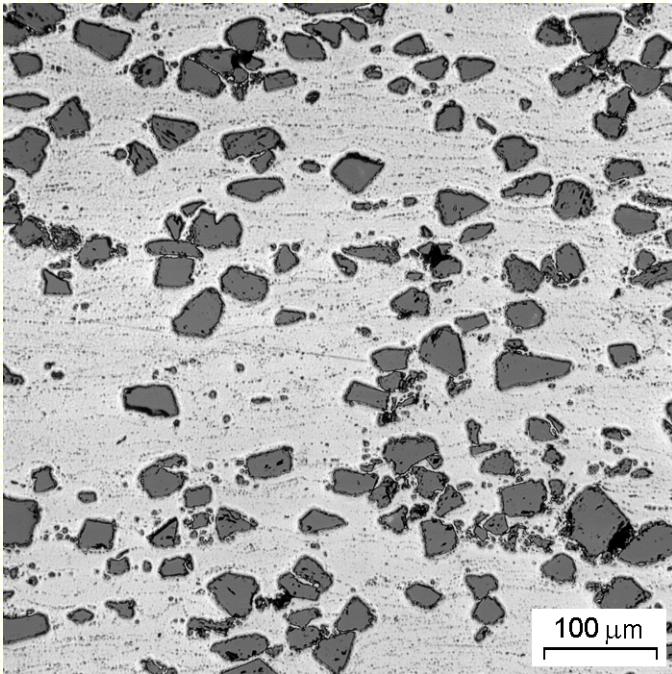

QE 22 + 20 vol.% COMPOSITE

## CONCLUSIONS I

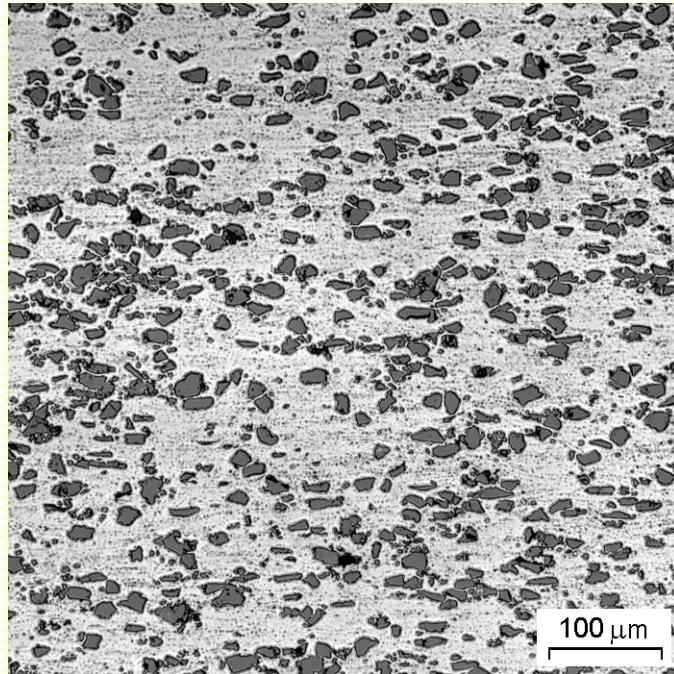

### Short-fibre reinforced AZ 91 and QE 22 alloys

- The creep resistance of squeeze cast AZ 91 and QE 22 magnesium alloys reinforced with 20 vol.% Al<sub>2</sub>O<sub>3</sub> short fibres (Saffil) is shown to be considerably improved compared to unreinforced matrix alloy.
- The matrix microstructure may influence the creep properties of the composite. The synergetic effects of microstructural changes are expected as factors governing the creep flow in the matrix of QE 22 composite.
- Creep strengthening in the composite arises mainly from:
  - (a) load transfer in which part of the external load is transferred to the reinforcement with a corresponding reduction in the level of the effective stress on the material, and
  - (b) the existence of a temperature-dependend threshold stress.

## **QE 22 + 15 vol.% SiC COMPOSITE**

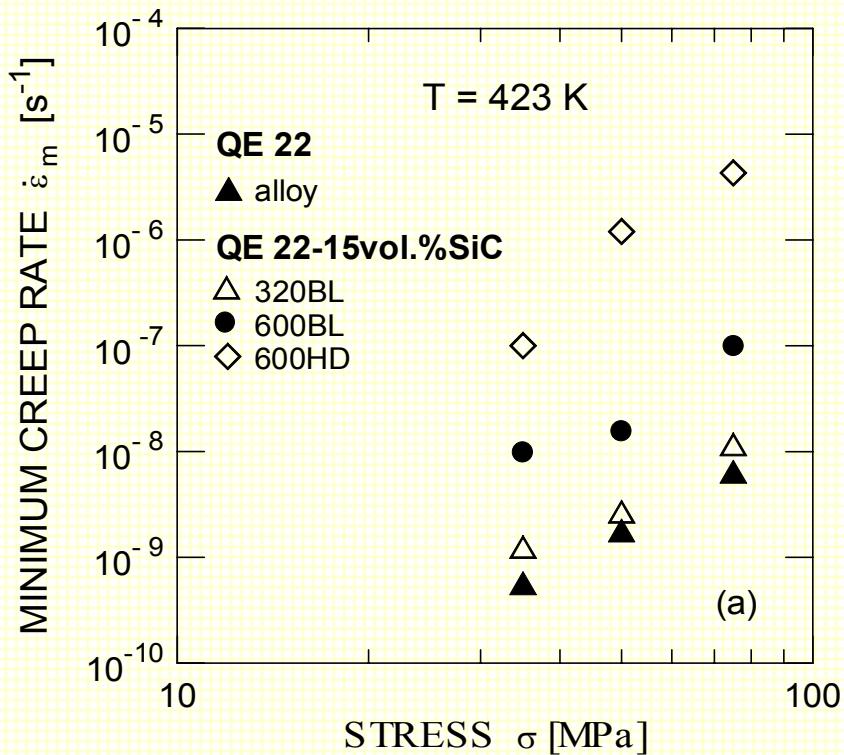

320 BL, 30  $\mu\text{m}$

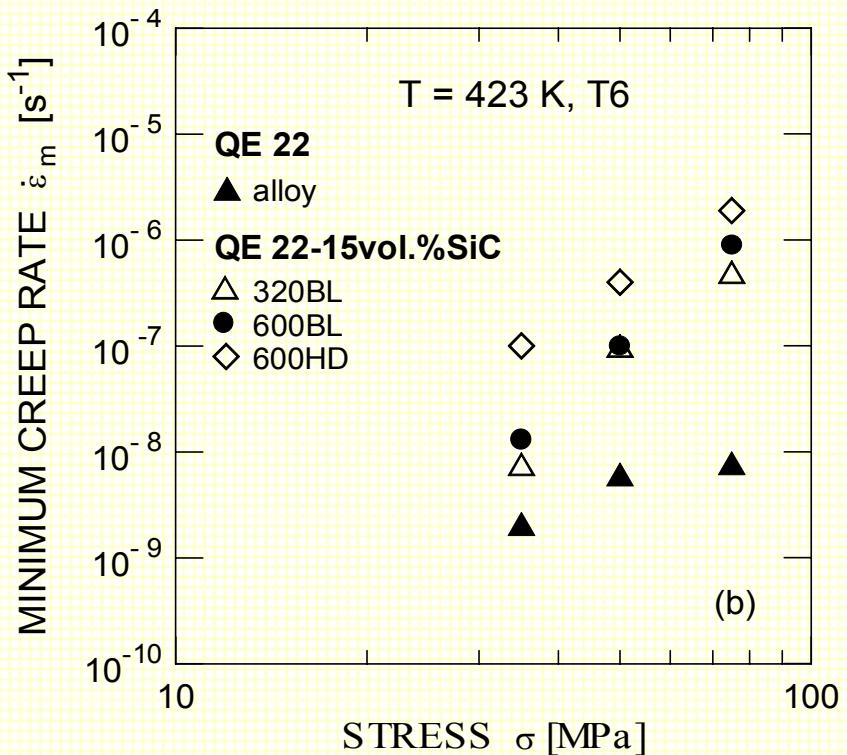

600 BL, 9  $\mu\text{m}$

Optical micrographs showing microstructure of QE 22 + SiC composites with different SiC particles

# CREEP RESULTS

as received state

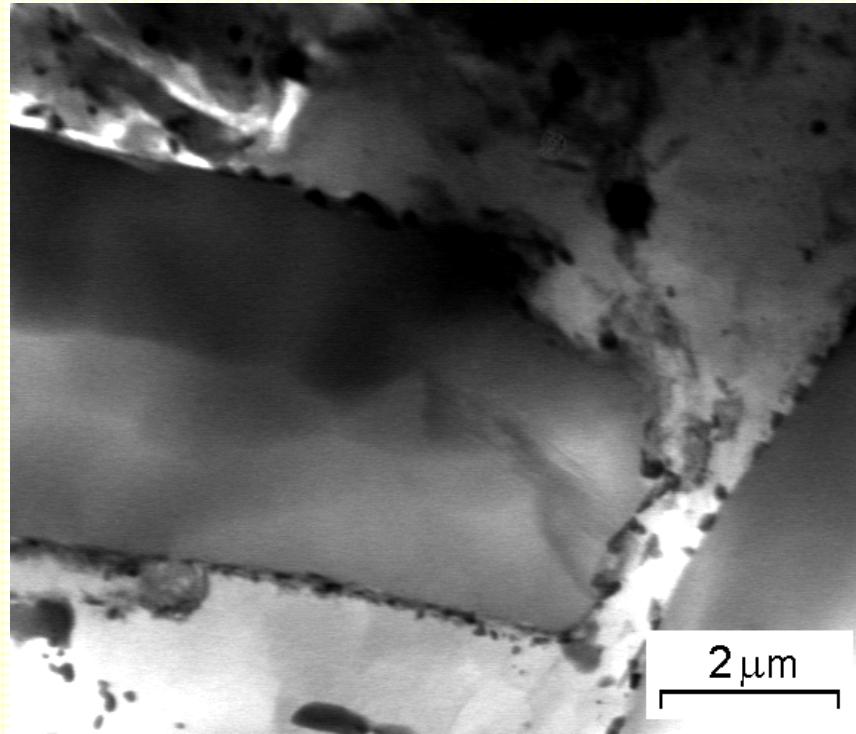

after T6 heat treatment

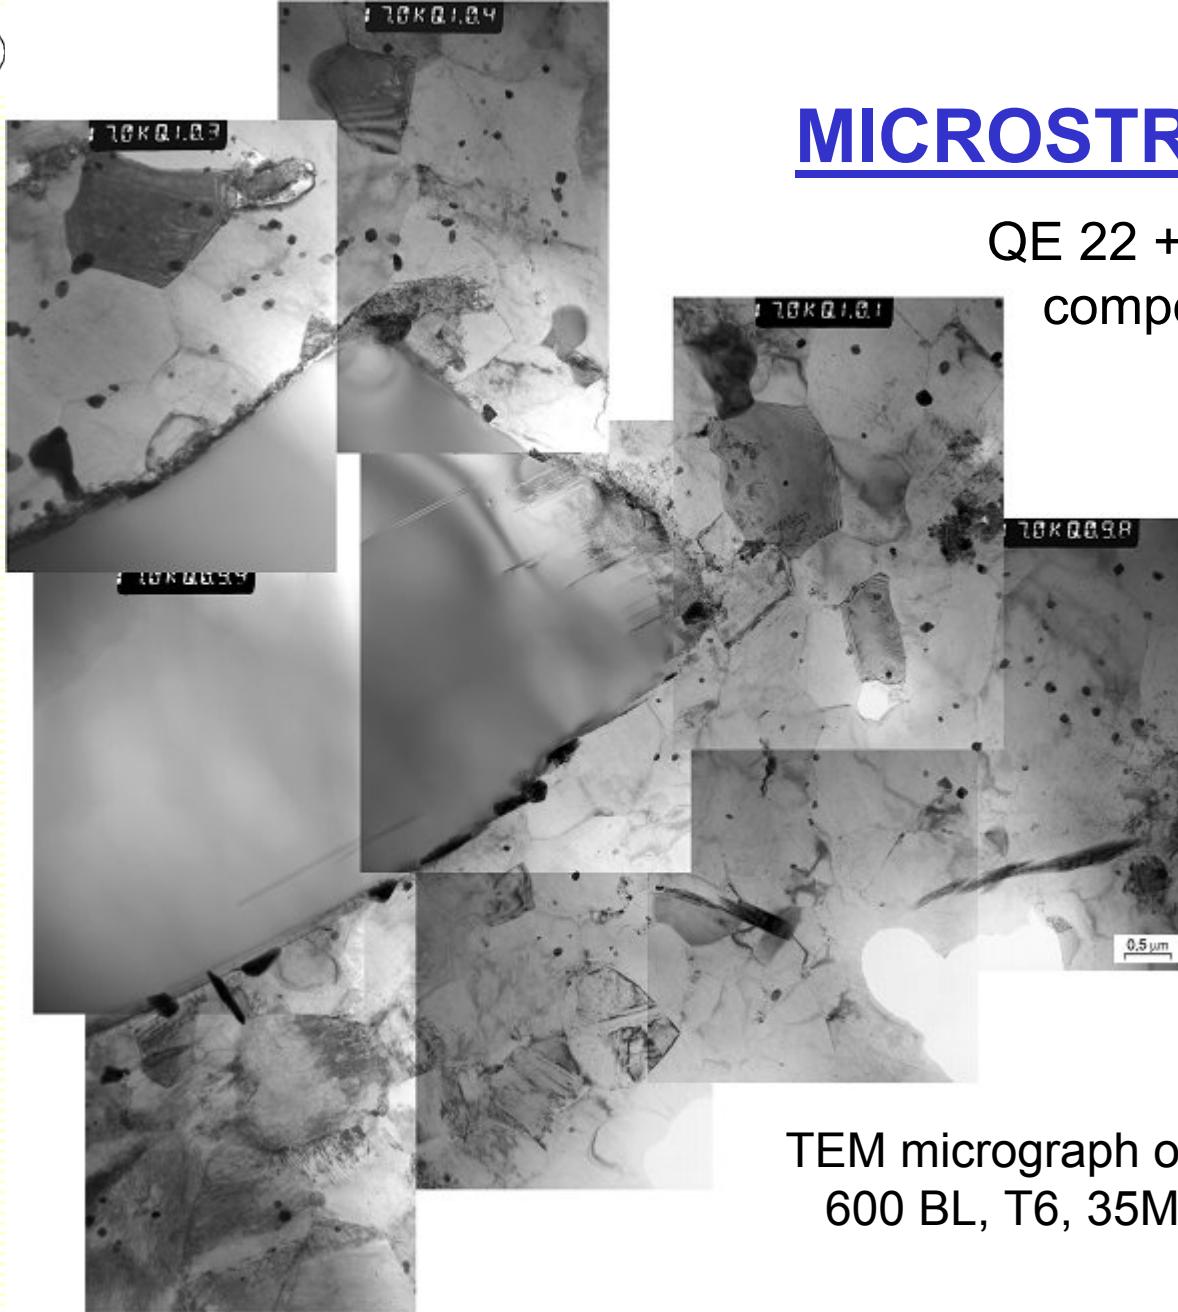

Stress dependences of minimum creep rates for the QE 22 alloy  
and the QE + 15 vol.% SiC composite at 423 K

# MICROSTRUCTURE

QE 22 +15 vol.% SiC (p) composite after creep

STEM micrograph of SiC particle. 600 BL, T6, 35MPa, 200 °C.

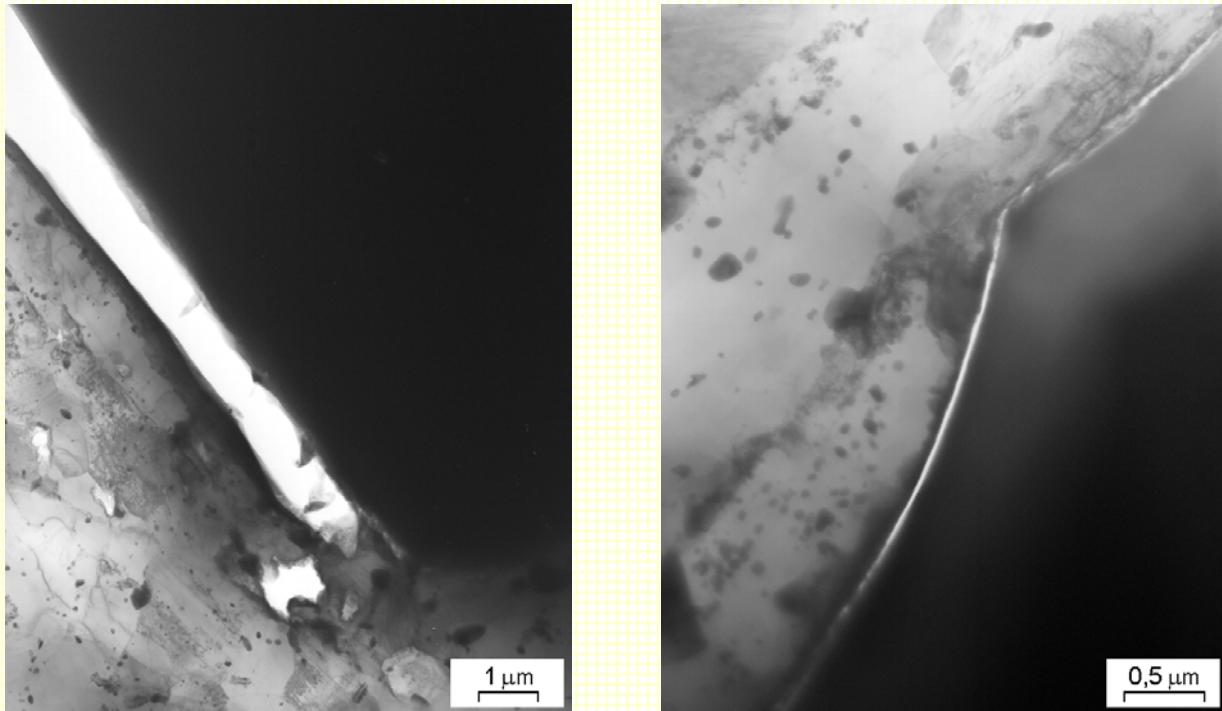

## MICROSTRUCTURE

QE 22 + 15 vol.% SiC(p)  
composite after creep

TEM micrograph of SiC particle.  
600 BL, T6, 35MPa, 200 °C.

# MICROSTRUCTURE

QE 22 +15 vol.% SiC (p) composite after creep

TEM micrographs showing crack at matrix/SiC interface.  
320 BL, T6, after creep.

## CONCLUSIONS II

### Particle reinforced QE 22 – SiC composite

An inferior creep resistance of the particle reinforced powder metallurgy QE 22 – 15 vol.% SiC (p) composite by comparison to the monolithic alloy is explained by following differences in the composite matrix microstructure:

- Enhanced precipitation of Nd-rich phases at the SiC/matrix interfaces in the QE 22-SiC composite after T6 heat treatment and during creep. Matrix depletion due to interfacial precipitation in the composite can produce precipitate inhomogeneity and deficiency in the matrix precipitate structure leading to the composite weakening.
- Debonding and decohesion of the SiC/matrix interfaces due to the nucleation and growth of creep cavities and/or microcracks.

**THE RESULTS INDICATE A DOMINANT IMPORTANCE  
OF THE CHOICE OF THE COMPOSITE MATRIX ALLOY  
AND THE REINFORCEMENT USED IN COMPOSITE DESIGN !**
